

Group 1

- In this group, I saw them work together on many issues that came up and asked for my help regarding the cooperation between NetBeans and GitHub. As such, I believe the group has gained a good understanding of GitHub, and as such have created a project crafted by each member of the team equally. The code seemed straight forward and easy to understand, and I feel that they left room for improvement if the project had required more. Overall, the group seemed to understand the task at hand and worked together using GitHub to complete the assignment.

Group 2

- The group seemed to have some problems near the beginning, as their code had caused some problems initially when setting up their own database. They worked on their project for quite a while, and integrated many features not seen in other version of the project. I commend them for working in and creating their own database using GitHub to keep the information updated. By doing so, they improved their knowledge of the application further than I expected.

Group 3

- This group seemed to have a basic understanding of the goal at hand when creating the project. Their GUI seemed a little confusing at first glance, as the options displayed to determine the data shown are somewhat confusing. The group struggled with some dynamic changing regarding the drop-down options, and the application of the text field data on the options. They also forgot a few steps along the way, so debugging the issues took them quite a while to figure out. Overall, the group looks like it has worked well together attempting to fix these issues and they used GitHub to collaborate on problems they found difficult alone.

Group 4

- They seemed to display an understanding of the project given and achieved their goal. They had many problems along the way that were fortunately solved. Overall, the group seems to have obtained a good understanding of the project's purpose and achieved more experience with GitHub. The GUI and web pages looked clean/simple, and I think that these qualities are an important factor. In an application like this, many people will use it to learn more about the virus' spread. As such, it is important to make it easy to navigate and understand.
